Starting Formulation

SF 6005

Chemical Resistant Floor Topping Epoxy
EPON™ Resin 828 / HELOXY™ Modifier 62 / EPIKURE™ Curing Agent 3370

Introduction
This floor topping formulation was designed for the majority of interior applications where resistance to a broad spectrum of chemicals is required. Typical of commonly encountered chemicals are alkalines, dilute acids, aliphatic hydrocarbon solvents, salt solutions, sugar solutions, greases, animal fats, oils, and acidic foods processed from milk, citrus fruits, tomatoes, vinegar, etc. This formulation can also be used for wear-resistant surfaces in industrial areas exposed to heavy vehicular traffic.

| Total Filler Portion            |          | 760.0  | 34.44   |

¹ Use the dry sand specifically graded for good packing and trowelling characteristics; available in standard weight bags for convenience. This sieve analysis is one characteristic of sands that will trowel well.

Compounding and Application

Clean old concrete substrates by either sandblasting or scarifying (Tennant grinding machine) to remove surface contaminants such as oils, fats, greases, waxes, membrane coatings, paints, etc. The laitance of new concrete can be removed with an acid etch (muriatic acid) followed by flushing with water, then scrubbing and drying.

To insure maximum adhesion, a prime coat of the unfilled binder (resin and converter portions) should be applied to the concrete substrate by brush, roller or squeegee. A coverage rate of 160 square feet/gallon (average film thickness of 10 mils) is suggested for highly porous substrates where heavier applications may be required. Then apply the topping system prior to gelation of the prime coat.

To prepare the topping system, blend the resin and converter portions in the designated ratio and mix until homogeneous. Power agitation is recommended, but manual stirring may be used if care is taken to accomplish thorough mixing. In either case, the sides and bottom of the vessel should be scraped frequently to insure complete blending. Pour the blended binder over the sand and mix in a KOL Mixal paddle-type mortar mixer, or with a drill motor powered agitator.

Distribute the sand/binder mix to the desired thickness and finish with a trowel. This procedure provides additional working life by permitting the heat of reaction to dissipate from the thinner sections. This procedure may be modified for applying skid proof toppings by broadcoating sand or abrasive grains over the ungelled topping. The excess (unwetted) grains are swept off after the epoxy binder has hardened.

General Information

These are starting formulations and are not proven in the user’s particular application but are simply meant to demonstrate the efficacy of the products and to assist in the development of the user’s own formulation. It is the user’s responsibility to fully-test and qualify the formulation, along with the ingredients, methods, applications or equipment identified herein (“Information”), by the user’s knowledgeable formulator or scientist, and to determine the appropriate use conditions and legal restrictions, prior to use of any Information.

Safety, Storage & Handling

Please refer to the MSDS for the most current Safety and Handling information.

Exposure to these materials should be minimized and avoided, if feasible, through the observance of proper precautions, use of appropriate engineering controls and proper personal protective clothing and equipment, and adherence to proper handling procedures. None of these materials should be used, stored, or transported until the handling precautions and recommendations as stated in the Material Safety Data Sheet (MSDS) for these and all other products being used are understood by all persons who will work with them. Questions and requests for information on Hexion Inc. (“Hexion”) products should be directed to your Hexion sales representative, or the nearest Hexion sales office. Information and MSDSs on non-Hexion products should be obtained from the respective manufacturer.
