Starting Formulation

SF 8014
Hand Lay-up FRP Matrix
EPON™ Resin 862 / HELOXY™ Modifier 68 / EPIKURE™ Curing Agent 3234

Introduction
This hand lay-up system allows for high filler loading due to its low viscosity. This capability allows this system to be used both as a laminating resin and as an adhesive system.

Suggested Uses
- Pipe fittings, flanges, man-ways, etc.
- General aviation parts
- General adhesive applications

Features
- Low viscosity
- Initial room temperature cure
- Post-cure recommended for optimum performance
- Excellent balance of physical and thermal properties

Chemical Description
- EPIKOTE Resin 862 is a bisphenol F epoxy resin
- HELOXY Modifier 68 is a difunctional reactive diluent
- EPIKURE Curing Agent 3234 is an aliphatic amine

Mixing Instructions
EPON Resin 862 and HELOXY Modifier 68 may be blended in any ratio in order to adjust the processing and performance. The 90/10 blending ratio by weight was selected to provide a balance of processability and performance. Both components are low in viscosity and may easily be blended at room temperature. Once the resin and the modifier have been blended, then the curing agent should be added. Keep in mind that the gel time of EPIKURE Curing Agent 3234 blended with this resin blend in a 100 gram mass is only 27 minutes. Please plan accordingly.

For adhesive applications, the addition and thorough mixing of fillers, thixotropic agents, etc. into the resin blend should be completed prior to the addition of the curing agent.

Composite Fabrication / Hand Lay-up
The initial cure step should be carried out at room temperature. An elevated temperature post cure may not be necessary depending on the requirements of the desired application. However, an elevated temperature post cure is recommended for optimum performance. Four hours at 82 °C (180 °F) was utilized to allow the use of low temperature tooling. The post-cure may be performed freestanding depending on the part geometry and tolerance required.

1 Cure Schedule: 12 hours at 25 °C (77 °F), 4 hours at 82 °C (180 °F).
2 Glass Transition Temperature; Differential Scanning Calorimetry, 20 °C/minute.
3 Wet conditioning: 7 days immersed in deionized water at 63 °C (145 °F).
4 Glass Transition Temperature; Dynamic Mechanical Analysis, 1 °C/minute.

General Information

These are starting formulations and are not proven in the user’s particular application but are simply meant to demonstrate the efficacy of the products and to assist in the development of the user’s own formulation. It is the user’s responsibility to fully-test and qualify the formulation, along with the ingredients, methods, applications or equipment identified herein (“Information”), by the user’s knowledgeable formulator or scientist, and to determine the appropriate use conditions and legal restrictions, prior to use of any Information.

Safety, Storage & Handling

Please refer to the MSDS for the most current Safety and Handling information.

Exposure to these materials should be minimized and avoided, if feasible, through the observance of proper precautions, use of appropriate engineering controls and proper personal protective clothing and equipment, and adherence to proper handling procedures. None of these materials should be used, stored, or transported until the handling precautions and recommendations as stated in the Material Safety Data Sheet (MSDS) for these and all other products being used are understood by all persons who will work with them. Questions and requests for...
information on Hexion Inc. ("Hexion") products should be directed to your Hexion sales representative, or the nearest Hexion sales office. Information and MSDSs on non-Hexion products should be obtained from the respective manufacturer.
